

## SOLUTION OVERVIEW

# DON'T BLOCK THE BOX

- PREVENT GRIDLOCK
- PROVIDE ACCESSIBILITY

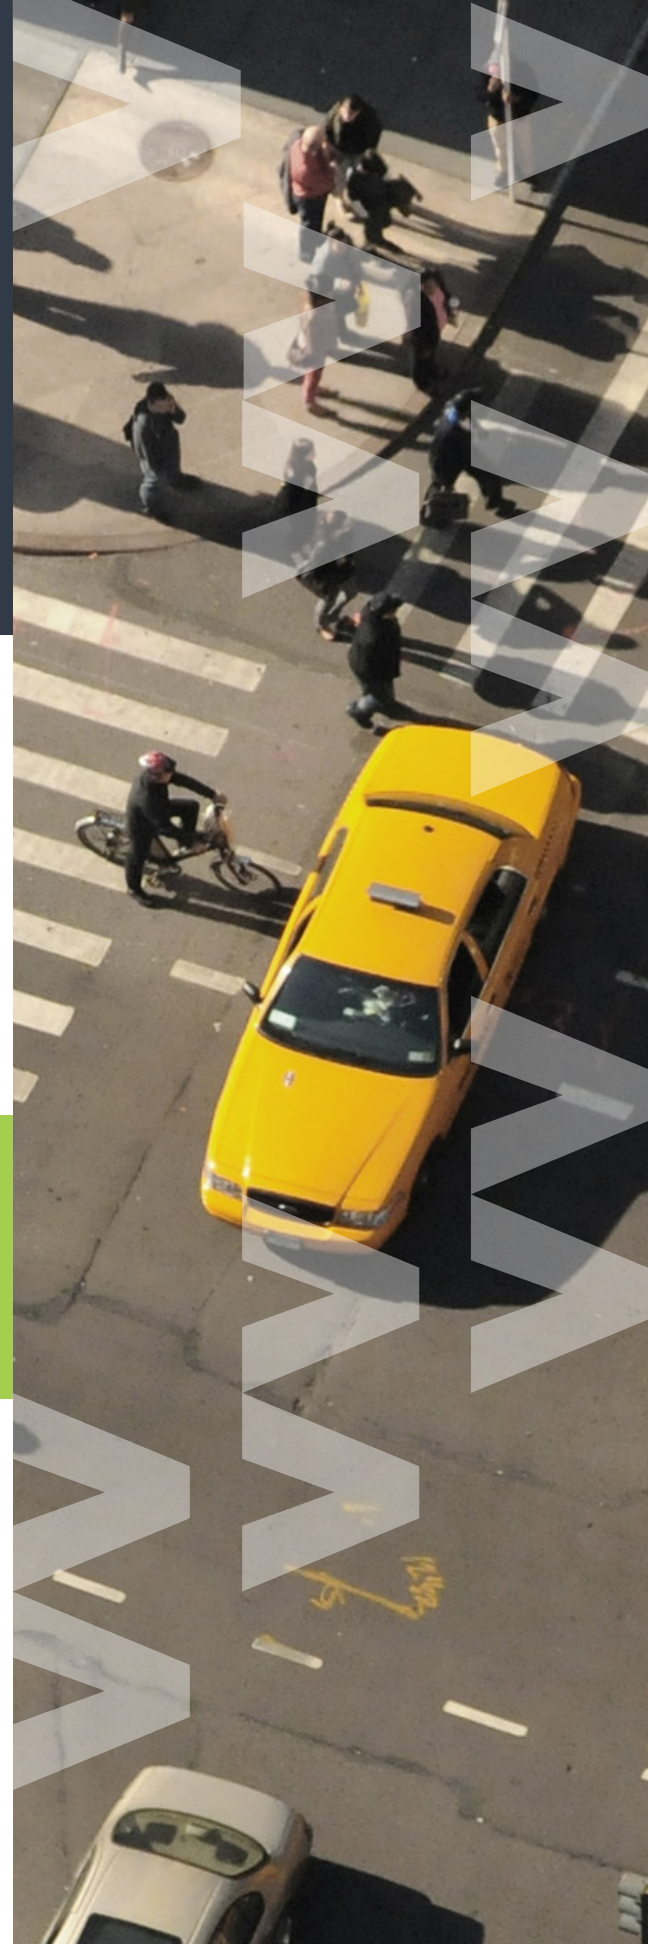

**BLOCKING THE BOX** is unsafe for people crossing the street and drivers traveling through an intersection. Blocked crosswalks critically impact vulnerable road users, particularly the disability community who are at risk for injury or death, forced to dangerously navigate around vehicles to access the curb.

Blocked intersections cause congestion which leads to a less efficient transportation system and a slower response time for first responders throughout a city.

**Make mobility safer and easier with an intelligent transportation solution that improves traffic flow, enhances safety for all travelers, expedites emergency vehicles, and reduces crashes in your community.**

The Verra Mobility Don't Block the Box solution provides consistent detection of unsafe driver maneuvers at busy intersections, including illegal turns, one-way streets, and no entry.

These enforcement efforts encourage traffic compliance, which in turn, improves traffic flow and clears crosswalks so that everyone can reach their destination in a safe and timely manner.

## BLOCK THE BOX VIOLATIONS

Blocked traffic lanes and crosswalks occur when a driver pulls into an intersection despite it being unlikely that the vehicle will be able to proceed through before the light turns red.

This unsafe act prevents cross-traffic movement, delays emergency vehicles, and endangers other travelers by obstructing crosswalks and bike lanes.

When a crosswalk or bike lane is impacted, pedestrians and bicyclists are forced to weave between cars, decreasing their visibility to other travelers.

## DON'T BLOCK THE BOX SOLUTION

Let us help your community enhance safety and enable mobility at signalized intersections by enforcing compliance for drivers who unlawfully block the box.

## HOW IT WORKS

Our around-the-clock automated safety camera system detects vehicles that are stationary within the intersection for longer than a lawful time period.

Upon detection, the system captures a full-color video of the event, including a high-resolution image of the license plate and all associated violation data.

The end-to-end solution includes all of the hardware, software, and services required to successfully adjudicate a violation.
